

The active struggle for food self-sufficiency by harm reduction of HIV / AIDS on agriculture.

Title: HIV / AIDS: An underestimated danger for agriculture and nutrition

This search aims to improve food security depends on agriculture by actively contributing to harm reduction of HIV / AIDS on the production of plants and animals property used by humans for its food.

It will allow us together with the collaboration of the local population to reduce the mortality rate of men, women as well as children due to vertical transmission through effective contribution to change their sexual behavior. Hence, the stability of the local skilled labor and that of production and people's access to information in order to reduce the digital divide between North and South.

We will implement the research action through various forms of intervention research including awareness, education; this without impeding the spontaneity and the "free space" field players but with the cooperation of the local population.

By our actions, we get the change in the sexual behavior of populations resulting reduction of the infection rate of HIV / AIDS through access to these ICTs, stabilizing the workforce, performance and de facto agricultural production. Hence, economic growth and food self-sufficiency of local communities.

Strengthening national political capacity to integrate control programs throughout the system of support to the agricultural sector, promote, and develop the basic sectors, including agriculture by increasing arable land. Popularize the technological contribution to education and training.
